

COVID19 guided project DQ

Venkat

13/08/2020

R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see <http://rmarkdown.rstudio.com>.

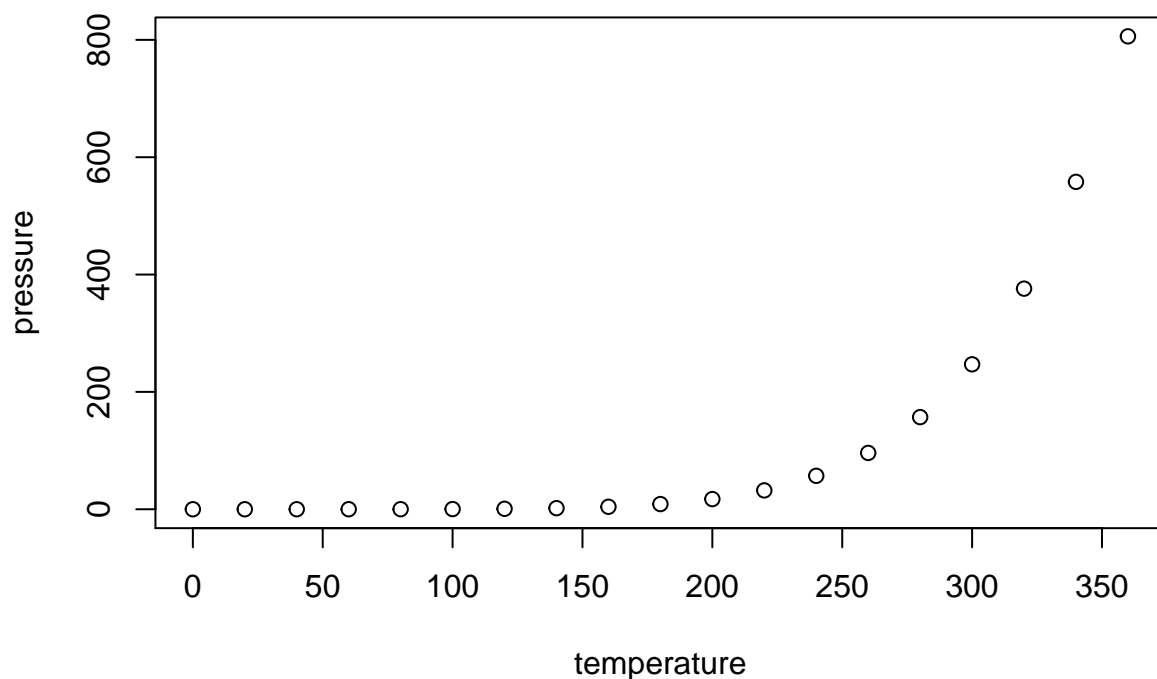

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

```
summary(cars)
```

```
##      speed      dist
## Min.   : 4.0    Min.   :  2.00
## 1st Qu.:12.0    1st Qu.: 26.00
## Median :15.0    Median : 36.00
## Mean   :15.4    Mean   : 42.98
## 3rd Qu.:19.0    3rd Qu.: 56.00
## Max.   :25.0    Max.   :120.00
```

Including Plots

You can also embed plots, for example:

Note that the `echo = FALSE` parameter was added to the code chunk to prevent printing of the R code that generated the plot.

```
library(readr)
getwd()
```

```
## [1] "/Users/venkatpgi/Desktop"
```

```
covid_df <- read_csv("covid19.csv")
```

```
## Parsed with column specification:
## cols(
##   Date = col_date(format = ""),
##   Continent_Name = col_character(),
##   Two_Letter_Country_Code = col_character(),
##   Country_Region = col_character(),
##   Province_State = col_character(),
##   positive = col_double(),
##   hospitalized = col_double(),
##   recovered = col_double(),
##   death = col_double(),
##   total_tested = col_double(),
##   active = col_double(),
##   hospitalizedCurr = col_double(),
##   daily_tested = col_double(),
```

```
## daily_positive = col_double()
## )
```

```
dim(covid_df)
```

```
## [1] 10903 14
```

```
vector_cols <- colnames(covid_df)
head(covid_df)
```

```

## 4 India         3692851   60959      0             0
## 5 Turkey        2031192  163941 2980960      0
## 6 Canada        1654779   90873   56454        0
## 7 United Kingdom 1473672  166909      0             0
## 8 Australia     1252900    7200  134586      6655
## 9 Peru          976790   59497      0             0
## 10 Poland        928256   23987  538203      0
```

```
positive_tested_top_3 <- covid_top_10 %>% mutate(positive_tested=positive/tested*100) %>% arrange(-positi
head(positive_tested_top_3,3)
```

```
## # A tibble: 3 x 6
##   Country_Region  tested positive  active hospitalized positive_tested
##   <chr>           <dbl>   <dbl>   <dbl>         <dbl>         <dbl>
## 1 United Kingdom 1473672 166909     0             0             11.3
## 2 United States 17282363 1877179     0             0             10.9
## 3 Turkey        2031192 163941 2980960     0             8.07
```

Another way of doing the above is by creating individual vectors (but not a good way; good for understanding)

```
countries <- c(covid_top_10$Country_Region)
tested_cases <- c(covid_top_10$tested)
positive_cases <- c(covid_top_10$positive)
active_cases <- c(covid_top_10$active)
hospitalized_cases <- c(covid_top_10$hospitalized)
country_matrix <- cbind(tested_cases,positive_cases,active_cases,hospitalized_cases)
rownames(country_matrix) <- countries
country_matrix
```

```
##           tested_cases positive_cases active_cases hospitalized_cases
## United States    17282363    1877179           0                0
## Russia          10542266     406368    6924890           0
## Italy            4091291      251710    6202214    1699003
## India           3692851       60959         0                0
## Turkey          2031192     163941    2980960           0
## Canada          1654779       90873     56454            0
## United Kingdom  1473672     166909         0                0
## Australia       1252900         7200    134586    6655
## Peru            976790       59497         0                0
## Poland          928256       23987     538203           0
```

Divide the vector positive_cases by tested_cases and then identify the top three ratio

```
positive_tested_top_4 <- positive_cases/tested_cases
head(positive_tested_top_4,4)
```

```
## [1] 0.10861819 0.03854655 0.06152337 0.01650730
```

Create a matrix for the top three countries with columns being Ratio, tested, positive, active and hospitalized

```
united_kingdom <- c(11.32,1473672,166909,0,0)
united_states <- c(10.86,17282363,1877179,0,0)
turkey <- c(8.07,2031192,163941,2980960,0)
covid_matrix <- rbind(united_kingdom,united_states,turkey)
col_names <- c("Ratio","tested","positive","active","hospitalized")
colnames(covid_matrix) <- col_names
covid_matrix
```

```
##           Ratio  tested positive  active hospitalized
## united_kingdom 11.32 1473672    166909         0           0
## united_states 10.86 17282363   1877179         0           0
## turkey         8.07 2031192    163941 2980960         0
```

Let us create a list to store all our variables / objects that we have created till now Create a character variable 'question' Create a named vector that contains answer to the question 'answer' Create a list then for df,matrices, vectors and store all three in a data_common_list Create a final list for 'question', 'answer' and 'data_common_list'

```
question <- "which countries have highest positive cases per tests?"
answer <- c("positive tested cases"=positive_tested_top_3)
df <- c(covid_df,covid_df_all_states,covid_df_all_states_daily,covid_df_all_states_daily_sum,covid_top_
matrices <- c(covid_matrix)
vectors <- c(vector_cols,countries)
data_common_list <- list(df,matrices,vectors)
covid_analysis_list <- list(question,answer,data_common_list)
covid_analysis_list
```

```
